```
> #
   # This part contains some special calculations
   # which are useful for search of primes N
   # for which N+2 and 2*N+1 are prime too.
   # We try to find p in the form N=h*2^e-1.
   # The test given by Riesel works with
   # discriminnant D if the there are integers
   # a,b,r such that (a+b*sqrt(D))^2/r is a unit
   # such that r=|a^2-b^2*D|, (D|N)=-1,
   # (r|D)(a^2-b^2*D)/r=-1. We are here interested
```

```
# for the choose D=13, a=3, b=1, r=4.
# The test is then applicable for those
# N, for which (13|N)=(N|13)=-1 and
# (13|2*N+1)=(2*N+1|13)=-1. This gives
# the condition h*7^e mod 13 is in {3,6,8}.
# In these cases N+2 mod 13 also not 0.
# We plan to use the modulus 30030=2*3*5*7*11*13.
# Because N, N+2 and 2*N+1 are certainly
# not divisible by 2, 3, 5, 7 and 11 if
# h divisible by 3, 5, 7 and 11, independently
# of the choose of n, we obtain a lot of cases
# in which the discriminant D=13 may be used,
# as follows:
#
# e mod 12 =0  : h mod 30030 = 5775,26565,10395
# e mod 12 =1  : h mod 30030 = 10395,5775,12705
# e mod 12 =2  : h mod 30030 = 12705,10395,28875
# e mod 12 =3  : h mod 30030 = 28875,12705,21945
# e mod 12 =4  : h mod 30030 = 21945,28875,3465
# e mod 12 =5  : h mod 30030 = 3465,21945,24255
# e mod 12 =6  : h mod 30030 = 24255,3465,19635
# e mod 12 =7  : h mod 30030 = 19635,24255,17325
# e mod 12 =8  : h mod 30030 = 17325,19635,1155
# e mod 12 =9  : h mod 30030 = 1155,17325,8085
# e mod 12 =10 : h mod 30030 = 8085,1155,26565
# e mod 12 =11 : h mod 30030 = 265775,8085,5775
#
#
# These where calculated by the following
# simple program:
#

  # This is a test to measure densities and times.
  # First pretests are done for N where
  # N=(h0+2*h)^2*2^(2*n)+1 and h runs from 0 to H-1.
  # The pretest is repeated for prime limit P=2^e where
  # e is integer from the interval eint. The time
  # and the number of remaining candidates after the pretest
  # is reported, and p*ln(P) also calculated, where p is the
  # relative frequency of numbers passed the pretest. The
  # result of the last pretest became the input of the
  # probabilistic test for N. The time and the result
  # of this test is also reported.

> #
  # This is a simple procedure to get all the prime pairs (p,q)

  # for which the quotient (p+1)/(q+1)=n is an integer,
  # 1<n<=N and 2<q<=Q. The limit Q is supposed to be small
  # and N is supposed to be large, hence primality testing is
  used.
  # The result is a list of pairs; each pair consist of n
  # and a list of all pairs [p,q] corresponding to this n.
  # The pairs are in increasing order.
  #

  prime_plus_one_quotient:=proc(Q,N)
